

A.I. Based Modeling in Seed Imaging Applications

*ISTA Annual Meeting 2023,
Mathematical Modeling in Seed Testing
Verona, Italy*

Kyle T. Peterson, Ph.D.
Bayer Crop Science, Innovation Science & Engineering
May 31, 2023

Agenda

- // Introduction
- // Background
- // Imaging technology for seed applications
- // Image analysis
- // How AI is used to automate image analysis
- // Overview of AI methods for image analysis
- // How Bayer is approaching imaging and AI to create more robust assays etc..
- // Benefits of AI compared to traditional Imaging applications
- // Q & A

Kyle T. Peterson, Ph.D.

Technologist | Researcher | AI and Imaging Expert

Professional Experience

- // *Senior Imaging Data Scientist - Bayer*
 - // 2019 - present
- // *Sr. Imaging Engineer - Monsanto*
 - // 2018-2019

Bayer CropScience

Ph.D. in Integrated & Applied Sciences

- // Saint Louis University
- // Imaging Science and Artificial Intelligence

SAINT LOUIS
UNIVERSITY
— EST. 1818 —

Professional Memberships

- // *Visiting Science Fellow, Saint Louis University*
- // *Executive Advisory Board Member, University of Missouri, Institute for Data Science & Informatics*
- // *Venture Innovation Team, Imaging and AI Expert, Bayer*

Technical Expertise

- // *Imaging*
 - // *Optical, Hyperspectral, Fluorescence, Thermal*
 - // *X-ray, CT and MRI*
- // *Artificial Intelligence*
 - // *Computer Vision, Deep learning, Neural Networks*
 - // *Data fusion*
 - // *Chemometrics*

The need for modernizing seed testing

A need and an opportunity

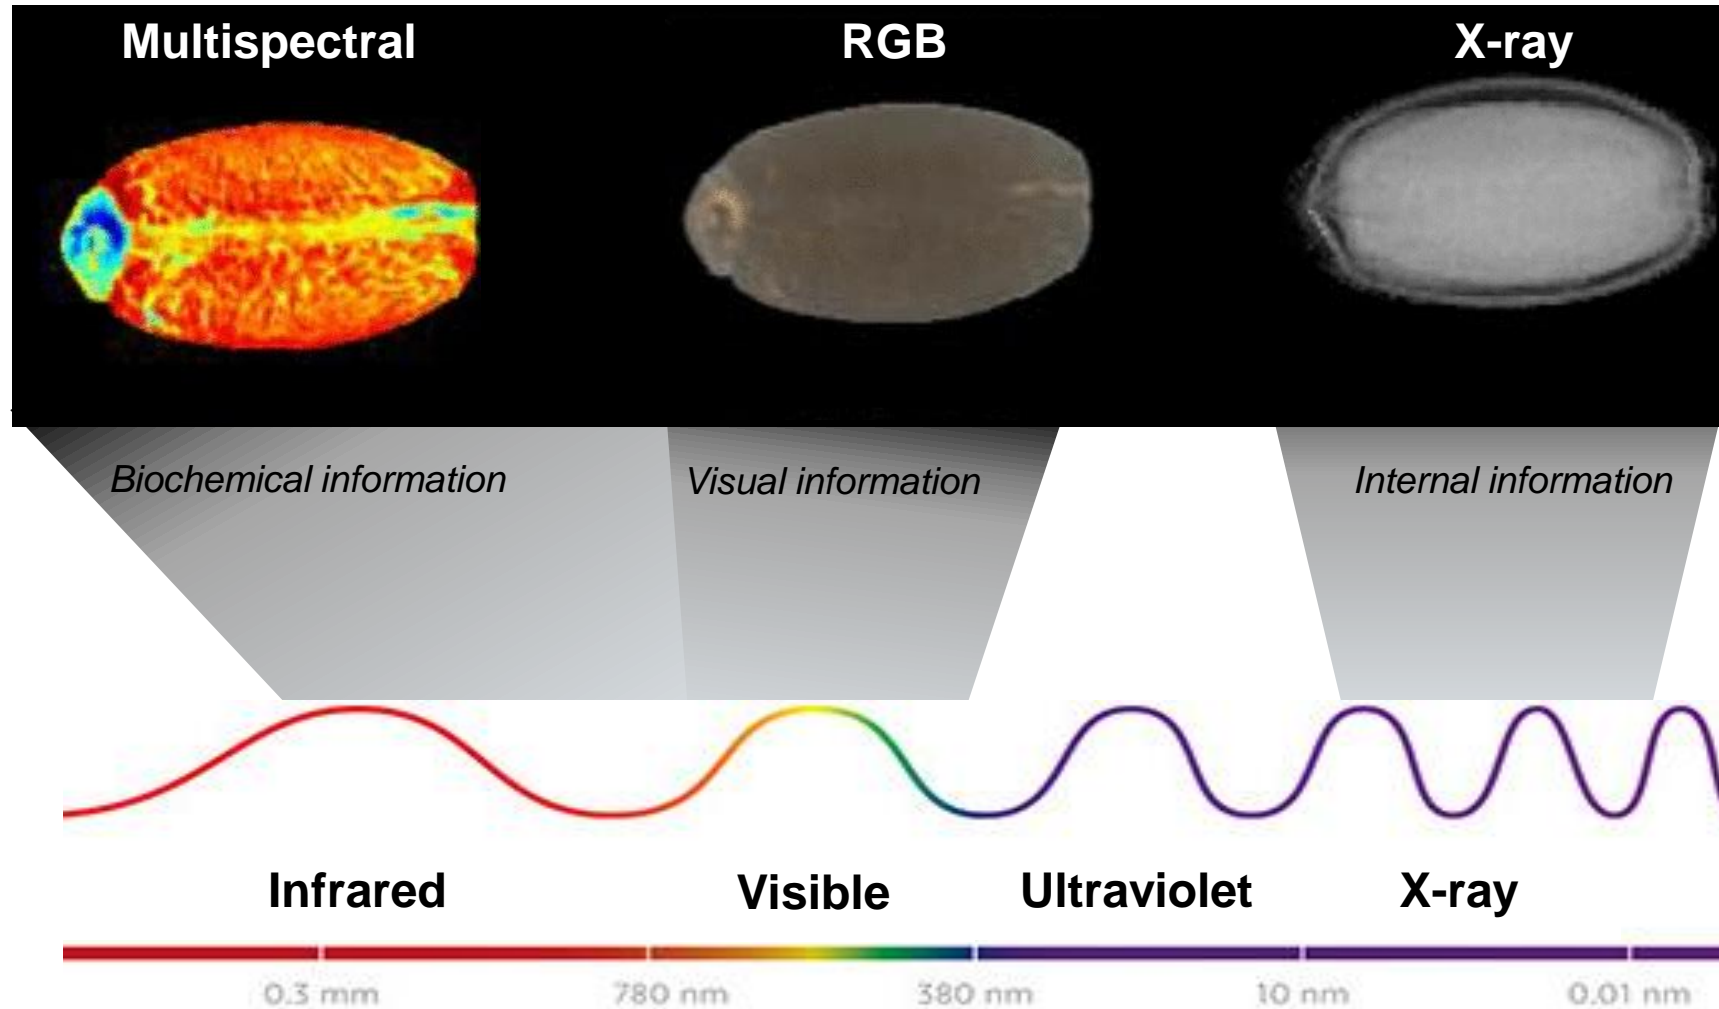

Issues with repeatability, standardization across labs, human subjectivity, training, time, operations, digitization, etc.

Imaging as a tool for seed testing

Seeing beyond the visible

RESTRICTED

Automated image analysis

Improving the testing process

Computer Vision

The science of extracting meaningful information from images

Human Vision

Computer Vision

Computer Vision Techniques

Semantic Segmentation

CAT GRASS
TREE

Pixels

Classification

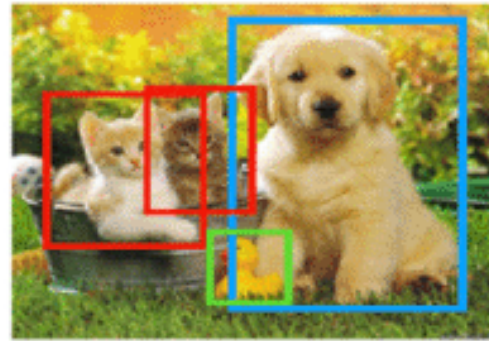

CAT

Classification + Localization

CAT

Object Detection

CAT DOG DUCK

Instance Segmentation

CAT CAT DOG DUCK

Single Object

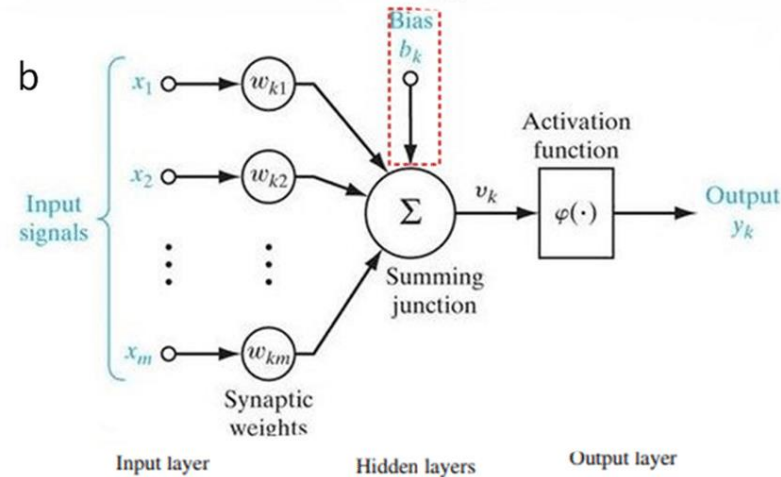

Multiple Objects

Inspiration from biology

Human neuron

Artificial neuron

Artificial neural network

The science of image analysis

Traditional machine learning vs. deep learning

Traditional machine learning uses hand-crafted features, which is tedious and costly to develop.

Deep learning “learns” hierarchical representations from the data itself, and scale with more data.

Benefits of deep learning

No need for feature engineering

Transferability across multiple sites and locations

Consistency and repeatability

Linear and non-linear relationships

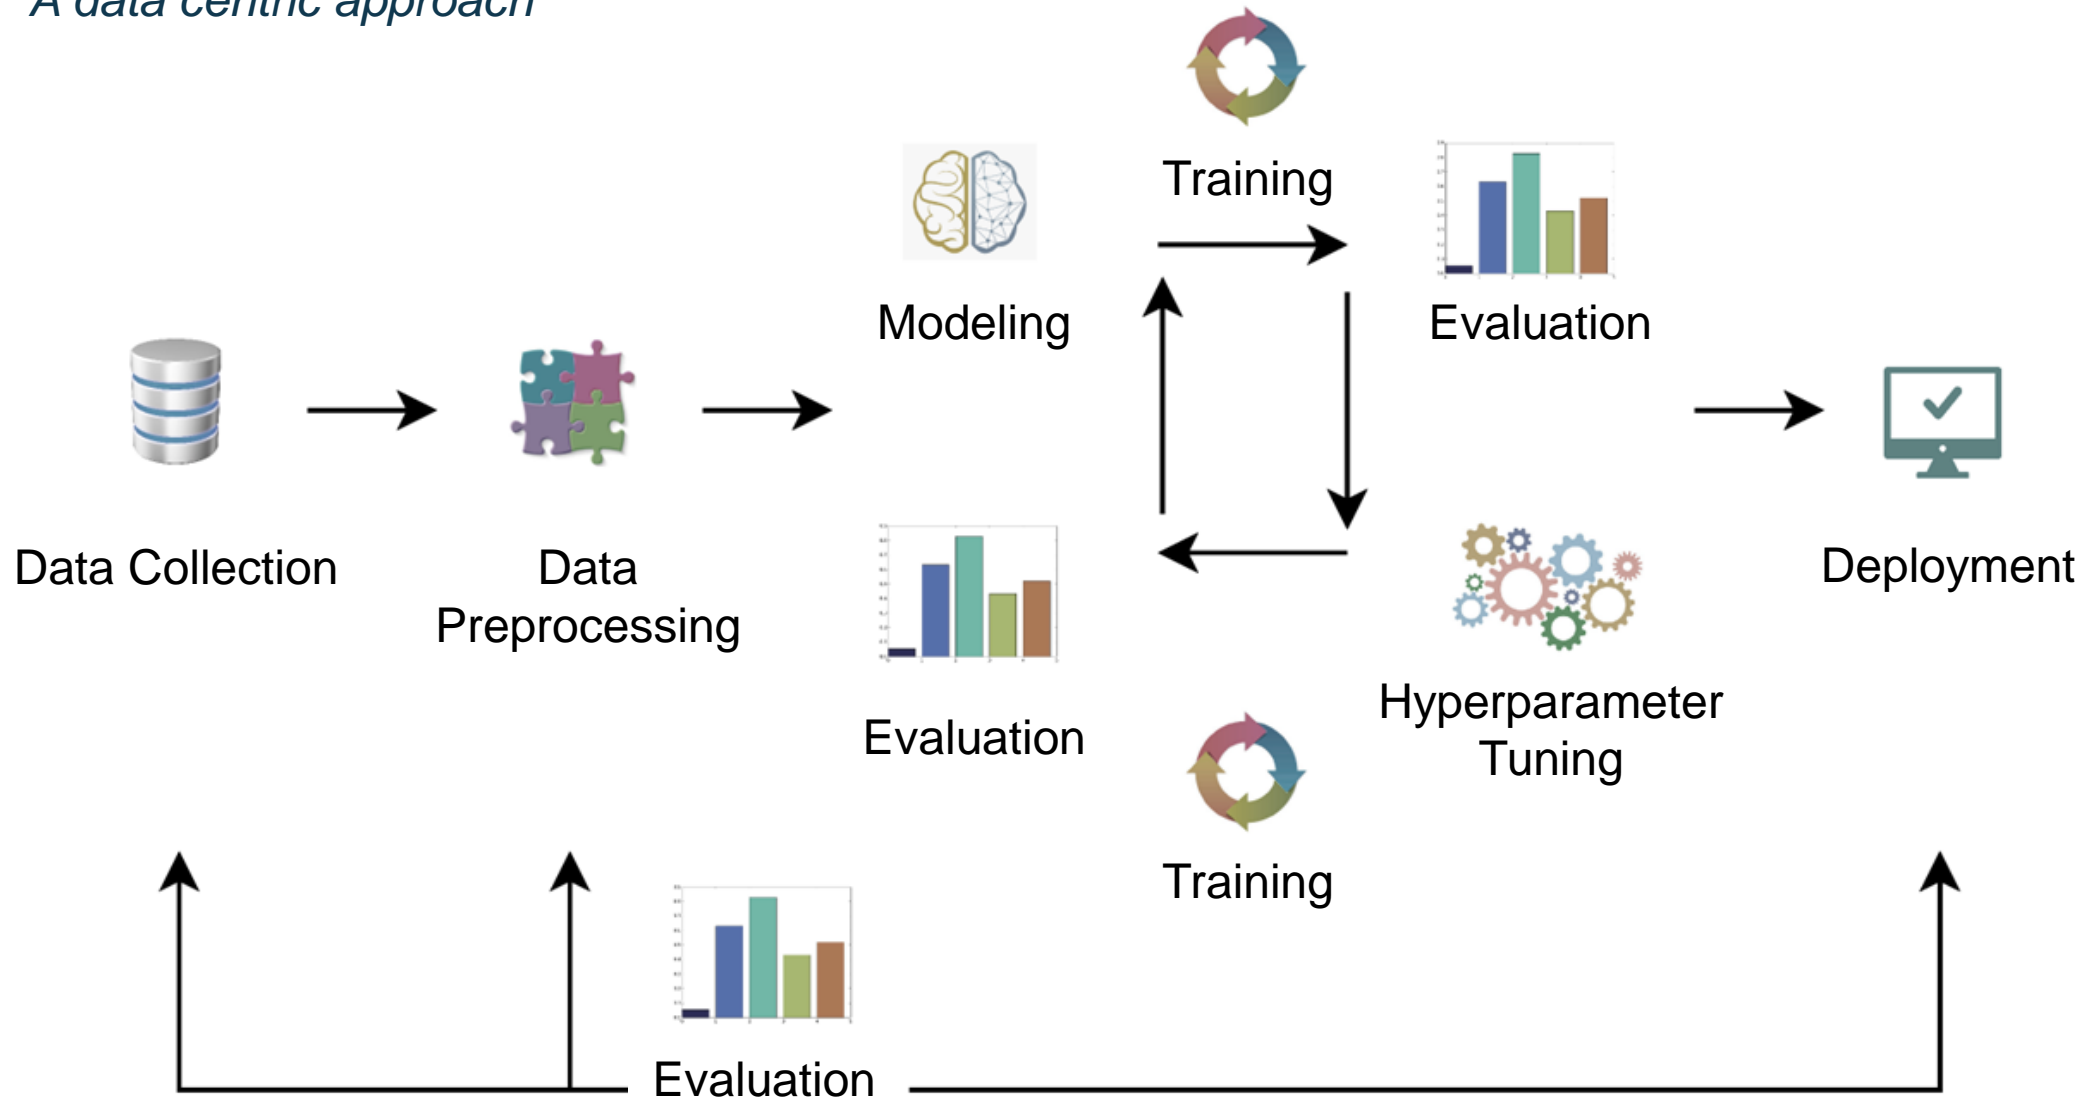

Improved accuracy*

Model development & training

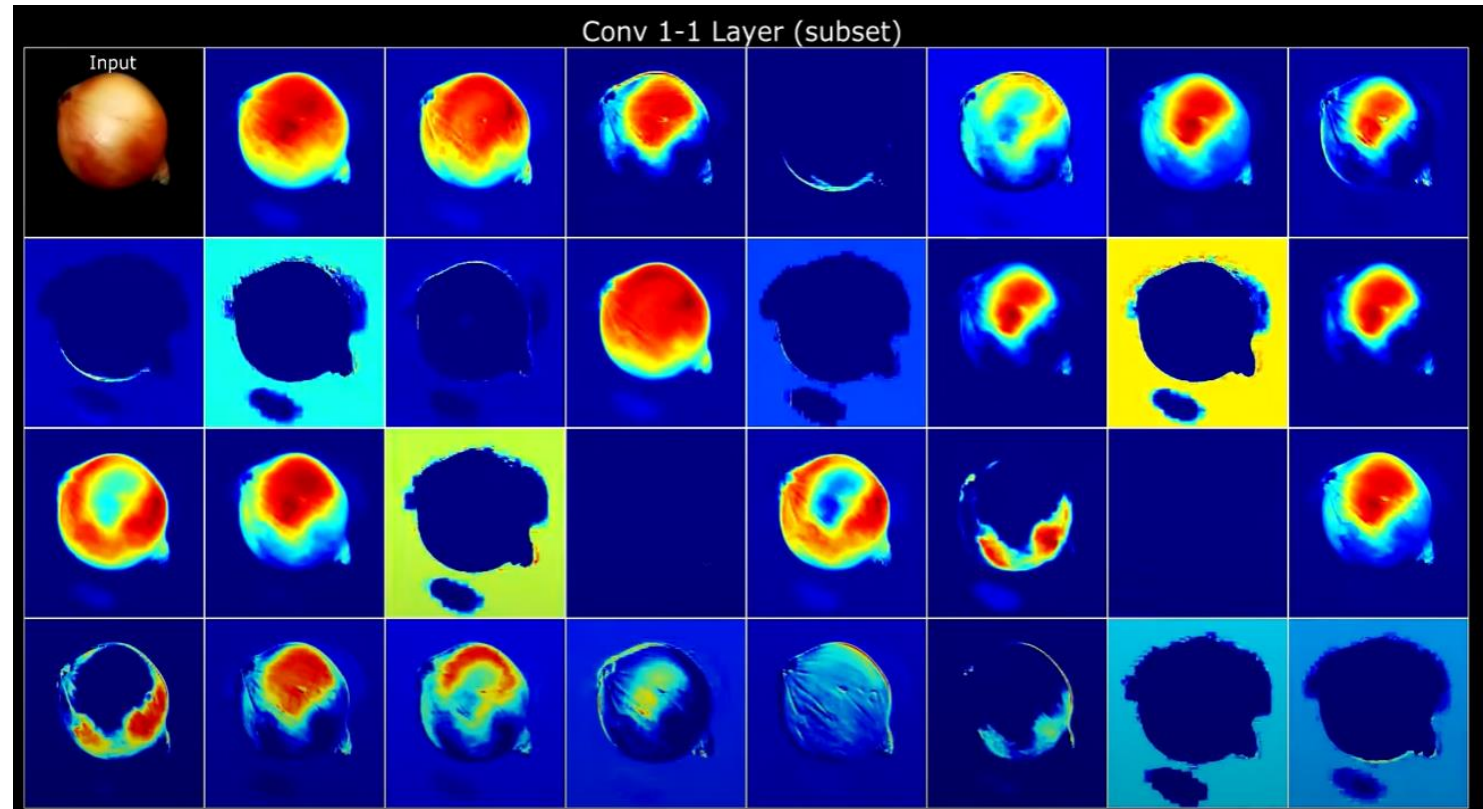

A data centric approach

Understanding models and their predictions

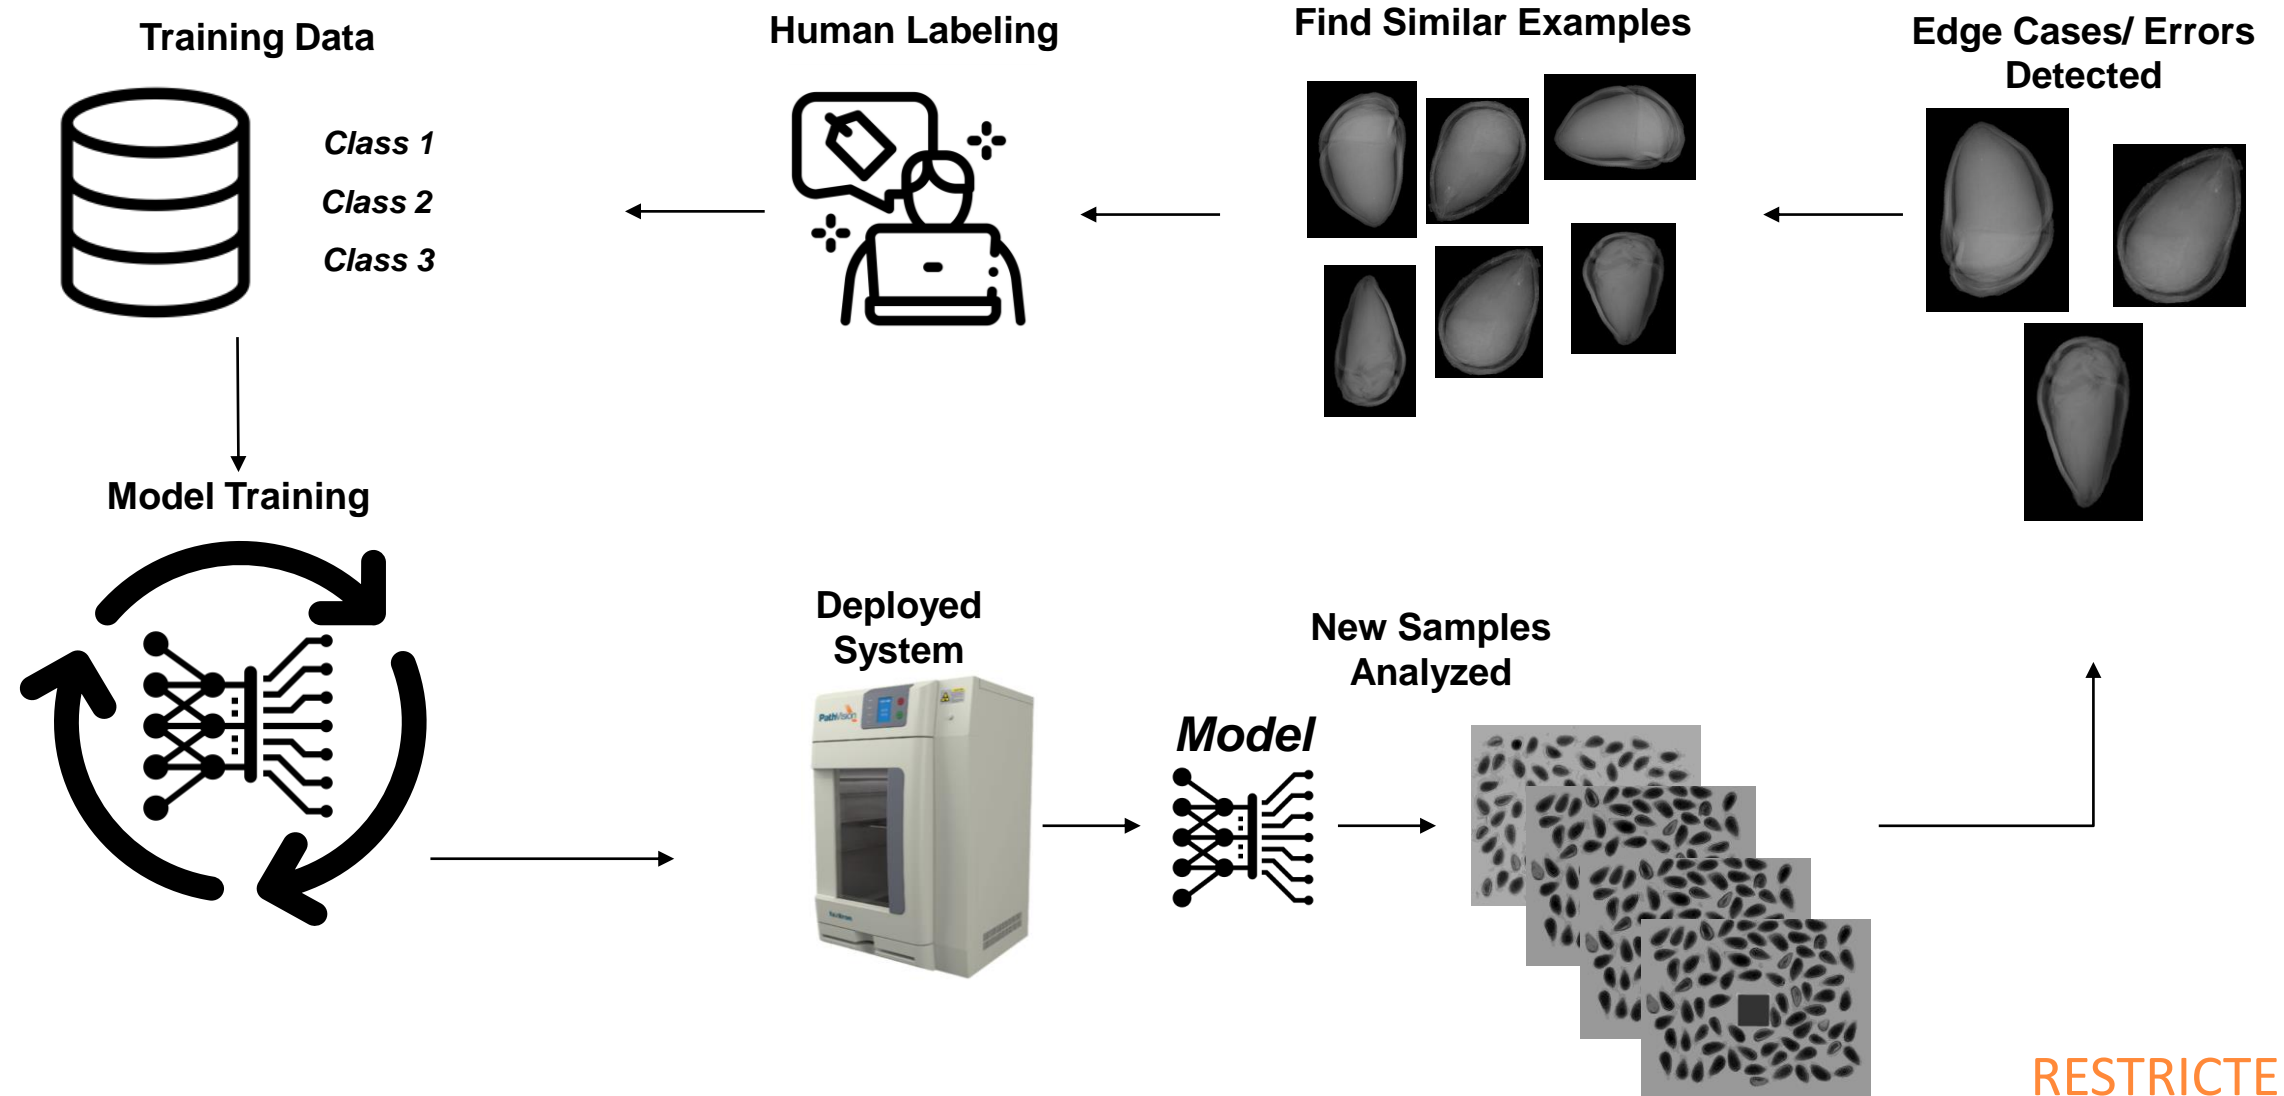

Class Activation Mapping

How can we maintain a model in real world use?

Creating a continuous learning cycle

RESTRICTED

Bayer's journey to modernize seed testing

Paving the way for the next generation of seed testing

A.I. + Imaging = Opportunity

Technology in both imaging and algorithms to process images are currently sufficient to meet many of the seed industries needs for modernization

Connecting technology & seed testing

Bridging the gap between technical experts and end-users.

Education

Embracing new technologies and educating seed testing experts.

Accelerating change

Working together with seed testing experts to develop and deliver impactful models and technology to improve operations.

Damage Detection Using X-ray

Visual Mechanical Damage Detection

X-ray Damage Detection

RESTRICTED

Seed Crack Detection Using X-ray

Severe cracking greatly impacts seed quality

Risk of poor germination, health and vigor
(Gomes-Junior et.al., 2019)

X-ray Crack Detection & Scoring

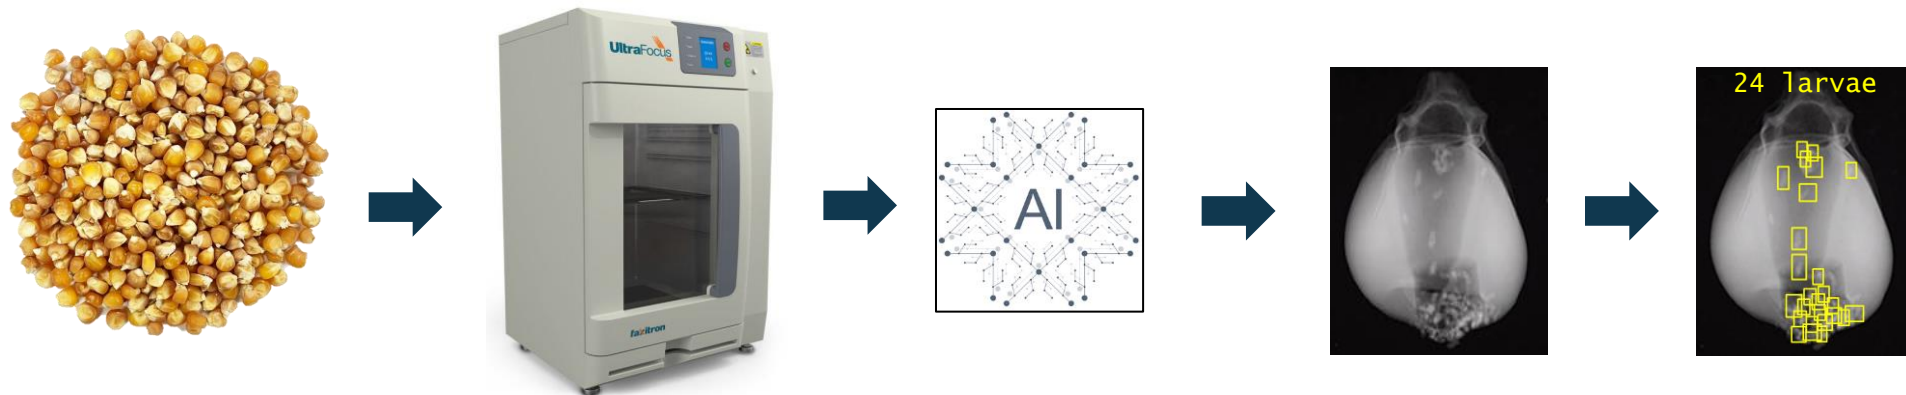

Insect Detection Using X-ray

Manual Test Protocol

Imaging + AI Test Protocol

A.I. + Imaging: enabling next generation seed testing

> Enhanced decision making via automated AI models

Improving consistency and speed of testing

> Improved testing methodology

Imaging systems that can see beyond the human eye paired with AI that is \geq human interpretation

> Creating testing consistency

Eliminating human subjectivity

Enabling time reduction in testing

Creating consistency in testing

Improving detection accuracy

Current Challenges to Implementation

- Existing pre-trained models often used for transfer learning not well suited for seed imaging tasks
- Almost zero publicly available datasets to supplement internal data
- Specificity and sensitivity of many seed tests are high
 - 99% accuracy or greater
 - Zero tolerance categories
- Trying to replicate human inspection flawed

The Future of Seed Testing

Imaging + A.I. to enable industry wide improvements in testing

Overcoming common pitfalls with imaging-based assays

Set new standards in testing

Deliver world-class **innovation**

Pioneer **digital** transformation
