International Rules for Seed Testing
2021

Validated Seed Health Testing Methods

7-001a: Detection of *Alternaria dauci* in *Daucus carota* (carrot) seed by blotter method

Including changes and editorial corrections adopted at the online Ordinary General Meeting 2020

Effective from 1 January 2021
Validation reports

See References. Copies are available by e-mail from the ISTA Secretariat at ista.office@ista.ch.

Please send comments, suggestions or reports of problems relating to this method to the ISTA Seed Health Committee, c/o ISTA Secretariat.

Disclaimer

Whilst ISTA has taken care to ensure the accuracy of the methods and information described in this method description, ISTA shall not be liable for any loss or damage, etc. resulting from the use of this method.

Safety precautions

Ensure you are familiar with hazard data and take appropriate safety precautions, especially during weighing out of ingredients. It is assumed that persons carrying out this test are in a laboratory suitable for carrying out microbiological procedures and familiar with the principles of Good Laboratory Practice, Good Microbiological Practice, and aseptic techniques. Dispose of all waste materials in an appropriate way (e.g. autoclaving, disinfection) and in accordance with local health, environmental and safety regulations.

Note on the use of the translations

The electronic version of the International Rules for Seed Testing includes the English, French, German and Spanish versions. If there are any questions on interpretation of the ISTA Rules, the English version is the definitive version.
7-001a: Detection of *Alternaria dauci* in *Daucus carota* (carrot) seed by blotter method

**Host:** *Daucus carota* L.

**Prepared by:** ISTA-PDC Method Validation Sub-committee

**Authors:** Sheppard, J.W., Cockerell, V. & Roberts, S.J.

**Revision history**

Version 1.0, 2003-01-01
Version 1.1, 2013-01-01: Definition of sample size
Version 1.2, 2014-01-01: Addition of positive control; common name of host added
Version 1.3, 2016-01-01: New Figures 1a, 1b
Version 1.4, 2017-01-01: Reporting results revised
Version 1.5, 2021-01-01: Sample size added and Methods revised

**Background**

This method was originally published in the *ISTA Handbook of Seed Health Testing* in November 1964 as S.3. No. 4 and revised in 1987 (Gambogi, 1987). It was incorporated into the *Annexe to Chapter 7: Seed Health Testing Methods* as method 7-001 (Sheppard & Cockerell, 2002). It has been renumbered (7-001a) and slightly modified following studies conducted by the International Seed Health Initiative for Vegetable Crops, ISF (ISHI-Veg) in 1999 and 2001 (Van Bilsen, 2003). The studies compared blotter and malt agar methods and concluded that the two were equivalent. Note that seeds can be simultaneously tested for the presence of *Alternaria radicina* using the same method (see method 7-002a).

**Treated seed**

Seed treatments may affect the performance of this test. It should only be performed on untreated seed.

**Sample size**

The sample (total number of seeds tested) size to be tested depends on the desired tolerance standard (maximum acceptable percentage of seeds infested) and detection limit (theoretical minimum number of pathogen propagules per seed which can be detected). The minimum sample size should be 400 seeds.

**Materials**

**Reference material:** reference cultures or other appropriate material

**Substrate:** blotters or filter papers, 90 mm, circular (e.g. Whatman No. 1 or equivalent), free from microorganisms and inhibitors (3 per plate)

**Plates:** 90 mm sterile Petri dishes (one per ten seeds)

**Incubator:** operating at 20 ±2 °C, equipped with timer-controlled near-ultraviolet lights (NUV, peak at 360 nm, e.g. colour number 08, Philips; BLB, Sylvania)

**Freezer:** operating at −20 ±2 °C

**Sample preparation**

It is vital to exclude any possibility of cross-contamination between seed samples. This can be achieved by swabbing/spraying equipment and gloved hands with 70 % ethanol.

**Methods**

Critical control points are indicated by CCP.

1. **Pretreatment:** None.
2. Place three 90 mm filter papers in each plate and soak with sterile distilled/deionised water. Drain away excess water.
3. Plating
   3.1 Aseptically place 10 seeds, evenly spaced (CCP), on the surface of the filter paper in each plate.
   3.2 Positive control (reference material): Aseptically place seeds evenly spaced (CCP) onto the surface of the filter paper in an appropriate number of plates to obtain the reference culture, or plate a reference culture on media. The number of plates required will...
depend on the level of contamination of the positive-control seed lot.

4. Incubate for 3 d at 20 ±2 °C in the dark.

5. Transfer plates to freezer and maintain at −20 ±2 °C for 24 h.

6. After freezing, incubate for 6 d at 20 ±2 °C with alternating 12 h periods of darkness and NUV light (ISTA, 1984; Tempe, 1968). Plates should be approx. 25 cm below the lights and should not be stacked.

7. Examine seeds under a stereoscopic microscope at ×30 for fungal growth and up to ×80 magnification for identification of conidia. Conidiophores are simple or slightly branched (Fig. 1), arising singly or in small groups from the surface of the seed or on aerial mycelium. Conidia are usually solitary, obclavate, up to 450 µm long (including beak), pale olivaceous brown at first, becoming brown with age, with a long pale beak up to 3 times the length of the body (Ellis, 1971). Groups of sunken conidia are sometimes visible by the emerging clusters of their bright long beaks (Fig. 1c). Compare with positive control. Record the number of infected seeds in each plate (CCP).

**General methods**

**Checking tolerances:** Tolerances provide a means of assessing whether or not the variation in results within or between tests are sufficiently wide as to raise doubts about the accuracy of the results. Suitable tolerances, which can be applied to most direct seed health tests, can be found in Table 5B Part 1 of Chapter 5 of the ISTA Rules, or Table G1 in Miles (1963).

**Reporting results:** The result of a seed health test should indicate the scientific name of the pathogen detected and the test method used. When reported on an ISTA Certificate, results are entered under ‘Other Determinations’. The report must indicate the number of seeds tested. In the case of a negative result (pathogen not detected), the results must be reported as ‘not detected’. In the case of a positive result, the report must indicate the percentage of infected seeds.

**Quality assurance**

**Specific training**

This test should only be performed by persons who have been trained in fungal identification or under the direct supervision of someone who has.

**Critical control points (CCP)**

- Spreading hyphae may lead to contamination of other seeds. Seeds must therefore be spaced at least 20 mm from each other with not more than 10 seeds per 90 mm Petri dish (Step 3).

- Samples may be difficult to examine due to the growth of contaminants, especially *Alternaria tenuis*, and/or *A. radicina*. Experience and great care is required for the detection of all occurrences (ISTA 1984) (Step 7).

- Supplementary examination may be required 13–14 d after plating of seeds to allow hampered or deeper inoculum to exceed contaminants by its fructification (Hewett, 1964) (Step 7).
